

FLYRANK ASSIGNMENT: Draw the Path: Portfolio Sitemap + Toolkit

Figure 1: Portfolio Sitemap

Figure 2: Claude Project Initialized

Output of Stress testing

1. What belief does the sitemap need to create?

Your claim has three separate sub-promises, not one. A skeptical visitor needs to walk away believing *all three*:

- You can actually build real things (not just study theory)
- You document your process (thinking, not just polished output)
- You improve through feedback (you're coachable, you iterate)

That third one is the trap most junior portfolios fall into — they prove #1 easily, gesture at #2, and almost never prove #3. If your sitemap only proves "I can build stuff," you've made 1/3 of your claim and left the recruiter to take the rest on faith. "Aspiring" already signals limited experience — the burden of proof on the *other* two claims goes up to compensate, not down.

2. Does each section strengthen the belief, or is anything unnecessary?

Structurally, nothing is unnecessary — Hero, Work, About, Contact is a legitimate minimal path. But two sections are currently underspecified in a way that could let them do less work than they need to:

- **About** risks becoming generic bio filler ("I'm passionate about data...") that restates the claim instead of adding new evidence. If About doesn't add proof that Selected Work didn't already show, it's dead weight sitting between your strongest section and your CTA.
- **Selected Work** is doing 80% of the persuasive labor here, and its current structure (Problem → Approach → Outcome) is built to prove *competence*, not *feedback-driven improvement*. See #3.

3. Does the selected work actually prove the claim? — This is the weak point.

Problem → Approach → Outcome is a good structure for proving "I can build things that work." It does **not** structurally prove "I document my process" or "I improve through feedback" — those require explicit artifacts a visitor can point to:

- Documenting process ≠ writing a clean final README. It means showing false starts, decisions you reconsidered, why you chose approach B over approach A.
- Improving through feedback means naming *actual feedback you received* (a mentor, a code review, a Kaggle discussion, a rejected model) and what you changed because of it.

Without those, a skeptical recruiter reads your three-part claim, sees case studies that only satisfy the first part, and quietly downgrades the other two to "unverified marketing language" — which is the exact failure mode "aspiring" candidates need to avoid, since they have no track record to fall back on.

4. Where could a visitor lose confidence or get distracted?

- If case studies resemble common tutorial projects (Titanic, Iris, a generic Kaggle notebook), skepticism spikes immediately — recruiters pattern-match this instantly.
- "Aspiring" in the hero, with no immediate concrete differentiator right next to it, reads as hedging. It needs a specific anchor in the same breath (a project name, a skill, a number) or it lowers confidence before Selected Work even gets a chance to build it back up.
- If About repeats claims already made in Work without new evidence, the visitor starts skimming — and skimming is where you lose the CTA click.

5. Does the site naturally lead to the one desired action?

Structurally yes — CTA at the top (Hero) and the bottom (Contact) brackets the whole page. But think about *when* a recruiter actually decides to act: it's usually right after Selected Work, at the peak of their interest, not after they've also read your About section. Right now that peak-interest moment has no CTA near it — they have to keep scrolling through About before they get another chance to act. That's a real conversion gap, not a nice-to-have.

6. Single biggest change

Make each case study explicitly surface feedback and iteration, not just outcome. Structurally: **Problem → Approach → Feedback/Iteration → Outcome**. This is the one change that closes the gap between what your claim promises and what your current sitemap can actually prove — everything else here is optimization, this is the piece that's missing.

(Secondary, smaller fix: add a lightweight CTA immediately after Selected Work, not just at Hero and Contact — you're currently making the interested visitor scroll past their decision point to find the action.)
